Further Fresh Kimberlitic Minerals recovered from Drilling Tsumkwe Diamond Project - Namibia

On 21 April 2005 the Company announced the recovery of 4 very fresh Class 4 kimberlitic garnets from RAB Drill Hole NAM 669, drilled in an area where previous loam sampling had recovered a number of G10 garnets and a diamond.

Recent results from RAB Drill Hole NAM 741 drilled 4km to the east and up (palaeo) slope of NAM 669 returned 2 Class 4 garnets (kimberlite indicator minerals with minimal amounts of wear). It is believed these fresh garnets indicate the presence of a probable local kimberlitic source.

Further drilling is currently being conducted in the immediate area.

**Martin Spence, BSc., M.Aus.I.M.M.
Exploration Director**

Classification of Indicator Mineral Grains to determine the Distance they have travelled

	<i>Mineral grains with remnants of their original surface</i>	<i>Mineral grains without remnants of their original surface</i>
<i>Grains that do not show any signs of wear indicating that they are either on kimberlite or have travelled only a short distance from a kimberlite source</i>	<i>Class 1</i>	<i>Class 4</i>
<i>Grains that show a slight amount of wear indicating that they have travelled a short to moderate distance from a kimberlite source</i>	<i>Class 2</i>	<i>Class 5</i>
<i>Grains that show moderate to extensive amounts of wear indicating that they could have travelled a moderate to a long distance from a kimberlite source</i>	<i>Class 3</i>	<i>Class 6</i>

All information in this report pertaining to exploration results, together with any related assessments and interpretations, has been approved for release by Mr. M Spence, BSc., M.Aus.I.M.M., a qualified geologist and full time employee of the Company, with more than five years experience in the field being reported on.
